New partition walls with individual niches

From January 2019 the Lux Elements Relax product group will feature two new partition wall elements made of hard foam support material with or without individual niche milling according to the customer's request. These are suitable for partitioning a flush with the floor shower area.

The new Relax-TW 900 (900 mm wide) and Relax-TW 1200 (1200 mm wide) partition walls are 2500 mm high and 100 mm thick. Those who would like one or more niches with a depth of 90 mm can choose the position and size themselves. An offset arrangement on both sides is also possible.

The advantages of the prefabricated partition wall elements are the easy handling, simple processing and fast completion, as no additional substructure is necessary. Apart from that the product is at the same time a support structure and standard-compliant substrate as per DIN 18534, so that no additional sealing is necessary in the private area.

Further information and an enquiry form for the ordering of niches are available at www.luxelements.com
